Talked about extended requirements—Carson is now taking on the sort tasks feature, Noah is doing filtration, and Renton is still working tags. The other two still need to choose their own features, though this is pending professor approval.

We are refactoring our code so that each feature is its own class.

The task manager will become a singleton, whereas we can easily prototype tasks themselves.

It was brought up that sorting and filtering are probably considered their own tasks, so Carson is planning on adding a task completion visualization.

Features as of the end of the meeting:

Noah—sort/filter

Carson—completion visualization

Renton—tagging

Catherine—TBD

Mitchell—TBD
